

LEVERAGING GENOMICS, GENETICS AND BREEDING TO UNDERSTAND CROP ADAPTATION TO NUTRIENT STRESS

Presented by

JAMIE O' ROURKE

Research Geneticist, USDA-ARS; Collaborator, Agronomy, Iowa State University

Agronomy and Horticulture Fall 2017 Seminar Series

Plants require many micronutrients for proper growth and development, but environmental conditions often limit soil nutrient availability resulting in stunted growth and reduced yield. We combine functional genomics, physiology and plant breeding to identify biological pathways and gene networks associated with nutrient deficiency responses and enhanced stress tolerance.

FRIDAY
December 8
3:30 pm

Refreshments served at 3pm

Keim Hall, Room 150, East Campus
University of Nebraska-Lincoln

LIVE STREAMING
