The fungicide resistance action committee (FRAC) assigns a number and/or letter to group active ingredients that have the same mode of action and target site. Repeated application with the same mode of action and target site greatly increases a pathogen's ability to develop resistance. Refer to pesticide labels and FRAC codes for assistance in rotating active ingredients. These codes can often be found in the upper corner of a fungicide label. Rotating active ingredients and modes of action, using of tank mixes with multi-site activity, and integrating non-chemical controls assist in managing fungicide resistance. DM = Downy Mildew, PM = Powdery Mildew | REI = Restricted Entry Interval in hours, PHI = Preharvest Interval in days.
