DEVELOPING HYBRID WHEAT: BEYOND THE THEORY

Presented by

SALLY CLAYSHULTE

Bayer Crop Science, Adjunct Associate Professor, Agronomy and Horticulture, University of Nebraska–Lincoln

Spring 2019 Agronomy and Horticulture Seminar Series

Clayshulte will discuss how the wheat hybrid system can be used as a basis to introduce new traits to increase the value of wheat. Open areas remain in bringing hybrids into the commercial seed market within North America and other regions. BASF purchased Bayer’s Seeds and Traits business in 2018, thus inheriting the hybrid wheat business. The legacy Bayer hybrid wheat strategy was based on observations of opportunities in wheat seeds and traits. Hybrid wheat development is based on genetics, experimental production systems, testing and selection. Different technology platforms can be utilized to identify and deliver value to wheat grains.

FRIDAY
March 1
3:30 pm
Refreshments served at 3 pm

Room 150, Keim Hall, East Campus
University of Nebraska–Lincoln
